

Initial Enhanced Brain Thing

Behind ear at back of jaw hinge----these points deliver sound from the 4 o'clock and 8 o'clock points....to cause sound to spread to lower backpart of skull

Points directly in front of ear deliver sound from 3'o'clock & 9'o'clock points to spread sound downward while leaving ears open

Points at jaw hinge deliver sound from 2'o'clock and 10 o'clock, and these points bring sound in involving the jaw, while also contributing to relaxing muscles in jaw

Enhanced points that add to the top 13 points of sound delivery allow most of the skull to be involved in perceiving sound. this helps balance electrical flows more through skull and neck, while contributing to the maximization of whole brain multi-hemisphere cross talk. Some people hear sound instantly from the top 13 points, while others can take a few minutes, or even hours, for the brain to adjust, and often the points near the ear are picked up first. By having these extra enhanced points it allows faster learning to perceive sound accurately via the skull, and after repeated usage, often the person has enhanced 3-D awareness eve without the device! In theory, because of what the extra points of perceiving sound can do, somebody who is mostly deaf, if wearing the device would actually be enjoying advantages over the person with regular hearing. Also noted is that when sound using bone conductivity travels through parts of the body holding stress from trauma, there is much trauma release and the affected parts of the body show incredible improvement gaining more permeant relaxation. This may help people with TMJ syndrome and neck problems significantly!
